Description

SUCCESS CRITERIA

We want 2 components types for google maps.

First, a simple map component that will allow the user the following:

Component / Rendering Name: **Simple Map**

Datasource item - Map Location (new template)

Fields - Location (geolocation field type) and marker text

Rendering Params - Zoom level, allows zoom, allows pan, class, show/hide

Second - components to allow multiple locations in a single map (Parent / Child)

Component / Rendering Name: **Map with Location Pins**

Rendering 1 - **Map (Parent)**

Datasource Item - Map Center (new template)

Fields - Center (geolocation)

Rendering Params - Zoom level, allows zoom, allows pan, class, show/hide (same as above)

Rendering 2 - **Map Location Pin**

Datasource item - Map Location (same template as above)

don't think you can select to show / hide specific locations
